

FTU

Fiber Termination Unit

The universal Fiber Termination Unit from Icotera supports all types of fiber installation methodologies and facilitates the use of single or dual-fiber in both cable and tube.

- No need to drill holes to lead a fiber through FTU walls
- 10 locations for fiber insertion points
- Space for winding up and reversing the fibers
- Room for gas block, fixtures for splicing rods and Wave-length Division Multiplexer (WDM) filter
- Minimizing installation and maintenance costs

Ease of Assembly

The whole FTU set consists of only 2 parts. Top cover simply locks on the FTU base and stays firmly secured. There is no need to use screws, pins or other separate elements to join both FTU parts. SCA caps are integrated with the cover - no risk of losing separate caps. Pre-cut kerfs simplify making openings for fiber - no need to drill holes in sides of the FTU cover.

Versatility of Use

Versatile FTU base may accommodate up to 2 meters of fiber, depending on the fiber diameter. Fiber can be lead through any of the 10 insertion points and winded or reversed in any direction. Icotera's FTU accommodates room for gas block, location for WDM filter, splicing rods, and SC/APC adapters.

Compatibility with Icotera CPEs

Icotera's FTU retains compatibility with all FTU-dedicated CPE/ONT models. Specially designed latches engage and block CPE on top of the FTU. Use of screw to join FTU and CPE together is optional. To dismount CPE from the FTU simply press latches and slide it off.
